# ANNUAL REPORT OF THE MEDICAL DEPARTMENT, BRUNEI FOR THE YEAR 1939

#### I.—INTRODUCTION

Brunei is a small State on the north-west coast of Borneo, having an area of 2,226 square miles, approximately one-tenth the size of Ceylon. The indigenous population is composed of Brunei Malays, Kedayans, Tutongs, Belaits, Dusuns, Dayaks and Muruts. The only alien race present in appreciable numbers is the Chinese.

The population is, with two exceptions, Brunei Town and Kuala Belait, scattered over the State in very small groups. The Bruneis, being mostly fisher-folk, keep to the large rivers. The other races, of which the Kedayans predominate, are on the whole agriculturists and are found in small communities over the whole State.

The largest grouping in the State occurs in the famous River Kampong—the original Brunei Town. Here, about one-third of the total population is aggregated into a picturesque collection of houses resting on wooden piles driven into the mud flats of the river. Many of the older women in this town have never walked on land. Rivers afford the chief means of transport, but motor transport is becoming more possible and more popular.

The Sultan of Brunei is the ruler of the State. The general administration is discharged by the British Resident, whose advice must be acted upon in all questions save those which affect the Mohammedan religion.

#### II.—ADMINISTRATION

The Medical and Health Department of the State is administered by a Medical Officer of the Malayan Medical Service. This officer, in addition, performs the duties of Assistant Controller of Labour.

Dr. O. E. FISHER continued to fill the post until May, when he was relieved by Dr. S. J. CAMPBELL, who officiated until the end of the year.

Appendix I gives the details of the full establishment.

During the year a trained midwife, a pupil midwife and a female attendant were added to the establishment.

The revenue collected during the year was \$2,214.42 whilst \$57,724.30 were expended. In addition \$1,140 was spent on health work (Sanitary Inspector's salary), Kuala Belait and there was a capital outlay on buildings, etc. of \$2,676.67. This makes a total of \$61,540.97 spent on Medical and Health Services, equivalent to 5.21 per cent of the total expenditure of the State. The figures for 1938 were revenue collected \$3,088.93, expenditure \$64,051.03 representing 8.91 per cent of the total State expenditure.

#### III.—HOSPITAL AND DISPENSARIES

The centre of the Medical Department is the general hospital at Brunei Town. This is a small moderately well-equipped hospital with accommodation for 48 patients. The building of a new operating theatre and the installation of water-borne sanitation was commenced in the latter half of the year and should be finished early in 1940.

There are two small dispensaries, in the out-lying parts of the State, each with a dresser in charge. The British Malayan Petroleum Company maintains an efficient hospital at Kuala Belait. The Company's own Medical Officer is in charge. By agreement with the Government this officer performs the duties of Health Officer for the district and the hospital facilities are available to the public.

The total cost is shown in Appendix II.

Travelling Dispensaries tend the needs of the remotely situated population. Three dressers are engaged in this work. They operate from the General Hospital and the two out-station dispensaries at Tutong and Temburong. Travel is by motor, by boat and by foot.

During the year 760 cases were admitted to Government Hospitals and 19,573 cases were treated as out-patients as compared with 614 and 19,435 respectively in 1938.

#### IV.—CHILD WELFARE AND MATERNITY

The Child Welfare and Maternity Clinic at Brunei continued to be very popular. The number of infants attending was 3,297. The figure for 1938 was 1,957.

During the year Child Welfare and Maternity Clinics were opened at Kuala Belait and Seria. The attendances there have been satisfactory and it is felt a definite start has been well established in these areas. A trained midwife is in charge of these clinics and does the midwifery practice of the surrounding districts. The Medical Officer of the Oil Company's Hospital generally supervises the work.

The infant mortality rate was 232 per thousand live births. The following table shows the corresponding figures for the past five years:—

Year Tota	al Births In	ifant	morta	lity	rate
1934 1	355	per	mille	live	births
1935 1	210	,,	,,	,,	,,
1936 1	374	,,	,,	,,	,,
1937 1	219	,,	,,	,,	,,
1938 1	210	,,	,,	,,	,,
1939 1	232	,,	, ,	,,	,,

Dietetic deficiency and insufficiency coupled with improper methods of infant feeding are the main causes of this high mortality. Ignorance and dread of leaving the infants in hospital allow one to see only too frequently an infant, marasmic from improper feeding, being taken back to its home for the killing process to be completed.

The Maternity Service is still doing most useful and increasing work. It is now thought that all births in the Brunei Town and River Kampong area are delivered by Government midwives.

The Department attended 715 births during the year. An increase of 175 over 1938. There were no deaths due to child birth during the year.

In the outlying districts, where native midwives hold sway, there were 15 deaths.

Details are given in Appendix V.

During the year 235 expectant mothers attended the ante-natal clinic. Of this number 71 were expecting their first baby.

The Health Nurse commenced a regular weekly itinerary of the Kampongs in the river. The number of cases, treated or given advice in this manner was 1,250. All these visits are done in a small boat rowed by two men. Much time is spent on the journey and it is felt that this can be overcome by the use of a small, shallow-draught, out-board motor-boat.

#### V.—PRISONS

The health of all prisoners in the State was good during the year.

#### VI.—PUBLIC HEALTH

#### (a) Housing

In the main centres of population Sanitary Boards control all matters relating to housing, sanitation, etc. On the whole the housing in these areas is satisfactory.

Native houses require constant supervision to prevent accumulations of refuse in their vicinity. They are usually of the two-roomed type, built on piles, except in the case of certain races which have large communal houses. Overcrowding is very marked even in the Sanitary Board areas. Steps are being taken gradually to lessen this unnecessary evil.

#### (b) SANITATION AND REFUSE DISPOSAL

In the Sanitary Board areas night soil is collected in buckets and dumped from a barge into a convenient tidal river. Bore-hole latrines are made where possible for the native houses on land. Nineteen of this type were constructed by the Health Department during the year.

Water-borne sanitation is increasing and a public latrine with this method of disposal was under construction in Brunei Town at the end of the year.

Street and domestic refuse is collected and disposed of by incineration or dumping into tidal rivers.

#### (c) WATER SUPPLY

In Brunei the river population obtains its water from a number of hill streams *via* small gauge pipes emptying into the river. The town supply is obtained from a small reservoir. The catchment area is not satisfactory and contamination probably occurs. Action is being taken to supply proper purification facilities.

Kuala Belait residents obtain their water from the British Malayan Petroleum Company. Tutong and Temburong have piped water supplies also. Elsewhere water is obtained from shallow wells and streams.

#### (d) FOOD ANIMALS

All cattle, pigs, etc. slaughtered in Brunei and Kuala Belait are inspected. During the year 84 cattle, 440 buffaloes, 67 goats and 1,716 swine were slaughtered. Five pigs were rejected for slaughter on account of disease.

Toward the end of the year a new buffalo slaughter house was started and will be ready for use in 1940. Plans for a new pig slaughter house are under consideration.

#### (e) Anti-malarial Measures

Regular anti-malarial work is only possible at Brunei, Kuala Belait and Seria and these places are kept free from the disease. In Brunei the area of control was extended during the year to include several places outside the Sanitary Board area. One thousand, nine hundred and sixty-five feet of new subsoil drains were constructed and 1,256 gallons of oil were used. In Kuala Belait and Seria the work is in the hands of the Assistant Resident who acts on the advice of the Oil Company's Medical Officer. The total cost of anti-malarial works in all supervised areas was \$6,397.81.

In rural parts of the State the distribution of free quinine is the only practical measure that can be carried out.

#### VII.—PREVAILING DISEASE

#### (a) MALARIA

One thousand and thirty-six cases of malaria were treated throughout the State by this Department compared with 763 cases in 1938. The increase has been general in all districts apart from the controlled areas but has been much more marked in the two outstations. This, I believe, is due to the extension of travelling dispensary services in these localities during the year. One hundred and eighty cases were admitted to Government hospitals with two deaths. One case of black-water fever was treated and made a good recovery. The main centres are kept free from malaria. There is also comparatively little malaria on the various rubber estates but it is exceedingly common in the rice growing areas. The commonest anophelines found in the rice fields are A. kochi, A. barbirostris and A. leucosphyrus.

A. maculatus was discovered breeding on two occasions in a small stream just outside the town of Brunei. This is only the second time that this anopheline has been reported in the State and it is unlikely that it is an important vector here.

Mosquito returns are given in Appendix VII. All school children are examined annually for enlarged spleens and treatment is given where necessary. Spleen rates are shown in Appendix IV.

The rates vary from nil to 69.51 per cent. All rates higher than 10 per cent were obtained from schools in padi growing areas. The rate for school children throughout the State was 6.84 per cent.

#### (b) Helminths

Ascaris infection is exceedingly common. All school children were examined once during the year and mass treatment given. This cannot, however, have any marked effect on lowering the incidence of the disease until the sanitary arrangements of the native population improve.

Hookworm is much rarer.

Routine annual examination of all Government servants followed by treatment was started in the year under review.

Of the stools examined by the staff of the Medical Department in the State—Ascaris was found in 46.2% and Ankylostoma in 7.8%.

## (c) Dysentery and Diarrhoea

There were nine cases of dysentery admitted to hospital during the year with no deaths. Infantile diarrhoea accounted for six admissions and one death.

#### (d) VENEREAL DISEASE

Gonorrhoea is fairly common, but comparatively few with the infection come for treatment. However, due to the efficacy of M. & B. 693 the number of cases attending hospital toward the end of the year was increasing.

Syphilis appears to be increasing in Brunei as more cases definitely infected in the State were seen than ever before.

#### (e) Tuberculosis

Tuberculosis is prevalent especially amongst the Chinese. Eighteen cases were treated in hospital during the year with five deaths. The disease is usually advanced when the patient offers himself for treatment and the prognosis is almost invariably bad.

#### (f) DEFICIENCY DISEASES

The poor diet of the majority of the population is still an important cause of ill-health in the State. Its relation to the high infant mortality has already been stressed. Thirty-three cases in the Brunei hospital were admitted for nutritional disorders, of one sort or another representing 4.3 per cent of the total admissions. This is a decrease of 16 from 1938. Most of the symptoms of avitaminosis (A., B and C.) have been seen during the year.

#### (g) MENTAL DISEASES

There are no proper facilities for the care of mental patients in the State, and most cases are sent to Singapore. There were, on an average, six cases maintained in the Singapore Mental Hospital throughout the year and the cost to the State amounted to \$745.16.

In addition 10 cases of mental disorder were treated in Brunei Hospital.

#### (h) OTHER DISEASES

There are at present in the State two known lepers, both Chinese. They are advanced cases and are housed in a separate ward in Brunei Hospital. There were no new cases during the year.

#### VIII.—VITAL STATISTICS

The estimated population of the State on 31st December was 39,387 as against 37,868 in 1938. Births totalled 1,830 and deaths 1,150 giving a birth rate of 46.46 per mille and a crude death rate of 29.20 per mille. In 1938 the birth rate was 37.79 and the crude death rate 22.00 per mille. The infant mortality rate was 232 per thousand live births compared with the corresponding figure of 210 in 1938.

Tables 2 and 4 of Appendix V show births and deaths by races.

Registration is probably fairly complete and the figures for births and deaths can be regarded as reasonably accurate.

Appendix V, table 3 shows causes of all deaths certified by registered Medical Practitioners.

#### IX.—ESTATES, ETC.

There are four European estates in the country and innumerable small native holdings. Records are only available of European estates where regular inspections are carried out. The general health during the year was good. There is surprisingly little malaria and dietetic diseases are definitely diminishing.

Estate labour consists almost entirely of Brunei natives, and is, for the most part, non-resident. The housing conditions of resident labour is satisfactory. Outlying estates each have their own dresser and small hospital. Serious cases are sent into Brunei. Estates near the town of Brunei make use of the Government hospital.

The largest employer of labour is the British Malayan Petroleum Company at Kuala Belait. This Company pays high wages and provides excellent housing conditions and other amenities for its labour. It also maintains a well equipped hospital in charge of a Medical Officer. Infant Welfare work continued to progress in this area.

#### X.—METEOROLOGY

The climate is of the tropical type and is characterised by a constant moist heat. The heat is usually tempered with a slight breeze and the temperature rarely exceeds 90° F. the usual daily range being between 76° F.—86° F. The annual rainfall is high and varies from 100 inches or more at the coast to over 200 inches in certain parts of the interior. The highest rainfall during the year was at Batu Apoi Estate where 241.74 inches were recorded.

S. J. CAMPBELL, Medical Officer, Brunei.
